

Presentation of Soloronix

Soloronix is a Swiss company founded in 1993 by the twin brothers Andreas & Toby Meyer, the first startup company to acquire a license for Dye Solar Cell technology from EPFL in 1994.

The expertise of Soloronix is divided into three activities: Materials, Solar Cells, and Equipment. Soloronix supplies specialty chemicals, materials, and components for next generation hybrid solar cells to researchers and industries worldwide, while also developing original photovoltaic panels based on this technology.

Equally important, Soloronix has engineered a unique sun-like light source which equips all the solar simulators we manufacture. Leading photovoltaic players can obtain accurate and dependable solar testing equipment in either standards models or customer-adapted realizations.
